

Allure Report

Interactive test execution reporting across frameworks and languages.

What Allure Report is

Allure turns test framework results into interactive HTML reports and relies on framework integrations/adapters to collect data.

Results and evidence

Use steps, parameters, logs and attachments to support investigation rather than simply adding volume.

Framework integration

Configure the adapter for Playwright, Pytest, JUnit, Robot Framework or your supported stack; Allure alone does not collect framework results automatically.

CI/CD use

Preserve result artifacts and publish reports securely in pipelines.

History and diagnosis

History can help identify duration trends, recurring failures and suite stability.

Attention point

A sophisticated report does not fix unreliable tests.

QA Tip

A report should reduce time-to-understand a failure, not only look attractive.
