

Maestro

Declarative mobile automation based on YAML flows.

What is it?

Maestro is a technology/platform relevant to Quality Engineering and test automation.

Official site and documentation

Use the official Maestro source as the primary reference: <https://maestro.mobile.dev/>. Official documentation should be the first source for installation, supported versions, syntax changes and new features.

When to use

Use it when the product and team context justify this type of automation or infrastructure.

Installation and setup

Consulte a documentação oficial para instalar a CLI e validar o ambiente antes do primeiro flow.

First use

Validate prerequisites, credentials/devices and run a small scenario before scaling.

Best practices

Keep configuration versioned and troubleshooting documented.

When to use it

Use this knowledge when product risk, architecture or the delivery stage requires this type of validation. Confirm the goal, environment, required data and expected evidence before starting.

How to start safely

Start from the official Maestro site and documentation. Confirm prerequisites, supported versions, operating system and required permissions. Learn in a controlled environment before using it in a critical workflow.

First QA-oriented use

Pick one small, verifiable task in Maestro, configure only what is necessary, run a simple example and confirm the outcome. Repeat with different data or conditions before adding abstractions.

Using it in a real project

Define where Maestro fits, who owns configuration, how credentials and data are handled and how results are shared. Integrate it into the team workflow instead of creating an isolated activity.

Adoption good practices

Standardize versions and configuration, document important decisions, keep secrets out of code and preserve reproducible examples. Reassess whether Maestro still delivers value as the product evolves.

Common issues and troubleshooting

When Maestro fails, verify versions, dependencies, permissions, connectivity, data and environment before assuming a product defect. Preserve the original error and reduce the issue to the smallest reproducible case.
