

Release, Go-Live and Hypercare

How QA contributes to readiness, release decisions, production validation and post-deployment support.

Release readiness

Before release, consolidate execution, open defects, known risks, integrations, evidence, rollback and exit criteria. QA provides information; business decisions need defined owners.

Go/No-Go

A Go/No-Go meeting evaluates evidence and risks. A high Pass Rate does not remove the need to examine defect severity and critical untested areas.

Post-deployment validation

Production smoke checks, monitoring, logs and critical integrations help confirm that deployment is operational without destructive actions on real data.

Hypercare

A period of increased attention after Go-Live. Teams monitor incidents, metrics, feedback and rapid fixes.

When to use it

Use this knowledge when product risk, architecture or the delivery stage requires this type of validation. Confirm the goal, environment, required data and expected evidence before starting.

How QA applies it

Start from the behavior or risk to validate, prepare data and environment, execute the technique or tool reproducibly and capture evidence that helps the team understand the result.
