

TestLink

Open-source Test Management for requirements, test cases, plans, builds, executions and reports.

What it is

TestLink is an open-source web application for test management and execution. It organizes projects, requirements, test specifications, plans, builds, platforms and results.

Official site and documentation

Use the official TestLink source as the primary reference: <https://testlink.org/>. Official documentation should be the first source for installation, supported versions, syntax changes and new features.

Workflow

Create a Test Project, organize Test Suites and Test Cases, build a Test Plan, associate builds/platforms, assign cases and record execution results.

Installation

TestLink is a server application rather than a simple desktop program. A typical setup requires a web server, PHP and a compatible database. Follow the documentation for the selected version.

Cases and steps

Cases can record objectives, preconditions, steps and expected results, while suites organize the library.

Execution and reporting

Plans and builds let teams execute selected sets and track Passed, Failed, Blocked and other statuses.

Integrations and cautions

Bug tracker and automation integrations depend on version/configuration. Review maintenance, security, compatibility and backups before corporate use.

How to start safely

Start from the official TestLink site and documentation. Confirm prerequisites, supported versions, operating system and required permissions. Learn in a controlled environment before using it in a critical workflow.

First QA-oriented use

Pick one small, verifiable task in TestLink, configure only what is necessary, run a simple example and confirm the outcome. Repeat with different data or conditions before adding abstractions.

Using it in a real project

Define where TestLink fits, who owns configuration, how credentials and data are handled and how results are shared. Integrate it into the team workflow instead of creating an isolated activity.

Adoption good practices

Standardize versions and configuration, document important decisions, keep secrets out of code and preserve reproducible examples. Reassess whether TestLink still delivers value as the product evolves.

Common issues and troubleshooting

When TestLink fails, verify versions, dependencies, permissions, connectivity, data and environment before assuming a product defect. Preserve the original error and reduce the issue to the smallest reproducible case.
