

End-to-End (E2E) Testing

Validation of complete flows across the product's main layers and integrations.

Purpose

Confirm that a business process works from start to finish across relevant systems.

Example

In e-commerce: login/guest, product, cart, checkout, payment, order and downstream integration.

Cost

E2E is usually slower, more fragile and expensive than lower-layer tests; keep a lean critical set.

Diagnosis

Combine E2E with logs, APIs and observability to quickly locate failures.

QA Tip: Use E2E for confidence in critical journeys, not to replace all component and API tests.
