What Allure Report is

Allure turns results produced by test frameworks into interactive HTML reports. It is framework-agnostic and relies on an integration/adaptor to collect the result files generated during execution.

Results and evidence

A useful report can present suites, tests, status, duration, steps, parameters and attachments. Screenshots and logs should help investigation and diagnosis rather than simply increasing the volume of evidence.

Framework integration

Configure the appropriate adapter for Playwright, Pytest, JUnit, Robot Framework or another supported stack. Installing Allure by itself does not automatically collect results from your test framework; the adapter must generate the expected result artifacts.

CI/CD use

In pipelines, preserve the generated result artifacts and publish the report where the team can access it. Define retention rules and make sure logs, parameters and attachments do not expose secrets or sensitive data.

History and diagnosis

When the integration preserves history, trends can help the team observe execution duration, recurring failures and suite stability over time, supporting investigation of regressions and flaky behavior.

Attention point

A sophisticated report does not fix poor or unreliable tests. Prioritize trustworthy results, clear test names and useful evidence before investing time in dashboard customization.
