

API Lab

Practice focused on requests, responses, contracts, errors and API investigation.

Build a request

Choose method, endpoint, headers, authentication and body, then compare the request with the expected contract.

Interpret the response

Analyze HTTP status, headers, body, schema, response time and effects produced in other systems.

Negative scenarios

Explore missing fields, invalid formats, authorization, duplication, rate limits, timeouts and unavailable dependencies.

When to use it

Use this knowledge when product risk, architecture or the delivery stage requires this type of validation. Confirm the goal, environment, required data and expected evidence before starting.

How QA applies it

Start from the behavior or risk to validate, prepare data and environment, execute the technique or tool reproducibly and capture evidence that helps the team understand the result.

Good practices

Prioritize high-impact scenarios, keep data and environments controlled, record important decisions and review the approach periodically to avoid redundant or outdated coverage.
