

Burp Suite

Web application security testing platform.

Proxy and analysis

Burp intercepts and analyzes HTTP(S) requests/responses to investigate application behavior.

Official site and documentation

Use the official Burp Suite source as the primary reference: <https://portswigger.net/burp/communitydownload>. Official documentation should be the first source for installation, supported versions, syntax changes and new features.

Community vs Professional

Community supports manual workflows; advanced/automated capabilities vary by edition.

QA use

It helps understand headers, cookies, authentication and request manipulation in authorized environments.

When to use it

Use this knowledge when product risk, architecture or the delivery stage requires this type of validation. Confirm the goal, environment, required data and expected evidence before starting.

How QA applies it

Start from the behavior or risk to validate, prepare data and environment, execute the technique or tool reproducibly and capture evidence that helps the team understand the result.

Good practices

Prioritize high-impact scenarios, keep data and environments controlled, record important decisions and review the approach periodically to avoid redundant or outdated coverage.

What it is and where it fits

Burp Suite is a tool or technology that can support Quality Engineering work. Before adopting it, understand the problem it solves, where it fits in the workflow and what evidence or productivity gain it should provide.

How to start safely

Use Burp Suite only in environments and targets for which you have authorization. Start by configuring the proxy and browser, validate interception with a harmless request, install/trust the CA certificate only where necessary, and prefer passive/manual analysis before any active or automated action.

First QA-oriented use

Pick one small, verifiable task in Burp Suite, configure only what is necessary, run a simple example and confirm the outcome. Repeat with different data or conditions before adding abstractions.

Using it in a real project

Define where Burp Suite fits, who owns configuration, how credentials and data are handled and how results are shared. Integrate it into the team workflow instead of creating an isolated activity.

Common issues and troubleshooting

When Burp Suite fails, verify versions, dependencies, permissions, connectivity, data and environment before assuming a product defect. Preserve the original error and reduce the issue to the smallest reproducible case.
