

Detox

Gray-box end-to-end testing framework for React Native apps.

What is it?

Detox is a technology/platform relevant to Quality Engineering and test automation.

Official site and documentation

Use the official Detox source as the primary reference: <https://wix.github.io/Detox/>. Official documentation should be the first source for installation, supported versions, syntax changes and new features.

When to use

Use it when the product and team context justify this type of automation or infrastructure.

Installation and setup

Follow the official Getting Started guide, configure the test runner and prepare the Android/iOS environment required by the project before running the first test.

First use

Validate prerequisites, credentials/devices and run a small scenario before scaling.

Best practices

Keep configuration versioned and troubleshooting documented.

How QA applies it in practice

Use Detox for end-to-end validation of React Native flows where synchronization with the app lifecycle is valuable. Keep scenarios focused on business-critical journeys and use lower-level tests for logic that does not require a full device/emulator flow.

How to start safely

Start from the official Detox site and documentation. Confirm prerequisites, supported versions, operating system and required permissions. Learn in a controlled environment before using it in a critical workflow.

Using it in a real project

Define where Detox fits, who owns configuration, how credentials and data are handled and how results are shared. Integrate it into the team workflow instead of creating an isolated activity.

Common issues and troubleshooting

When Detox fails, verify versions, dependencies, permissions, connectivity, data and environment before assuming a product defect. Preserve the original error and reduce the issue to the smallest reproducible case.
