

E-commerce Testing

Catalog, PLP, PDP, inventory, pricing, promotions, cart, checkout, orders and integrations from a QA perspective.

End-to-end flow

E-commerce connects product discovery, catalog, pricing, inventory, cart, identity, address, shipping, payment, order and post-purchase. QA should understand dependencies across these stages.

Catalog, PLP and PDP

Validate search, categories, filters, sorting, variants, images, availability, price, promotions, content, relevant technical SEO and consistency between listing and detail pages.

Cart and checkout

Test quantities, removal, coupons, recalculation, persistence, guest and registered flows, address, delivery, taxes, invoicing, payments and duplicate-order prevention.

Integrations and regression

Inventory, ERP, payments, fraud, logistics and notifications may fail beyond the UI. Risk-based regression should prioritize purchase, payment, order creation and critical integrations.

When to use it

Use this knowledge when product risk, architecture or the delivery stage requires this type of validation. Confirm the goal, environment, required data and expected evidence before starting.

How QA applies it

Start from the behavior or risk to validate, prepare data and environment, execute the technique or tool reproducibly and capture evidence that helps the team understand the result.
