

Grafana

Dashboards and exploration of observability data from multiple data sources.

What Grafana is

Grafana lets you query and visualize data from different sources in panels, charts and dashboards. It does not replace the data source: it connects to systems such as Prometheus and other backends.

Data Sources

Before creating dashboards, configure the data source and validate connectivity and permissions. Dashboard quality depends on the quality and semantics of the available data.

Dashboards for QA

QA can monitor latency, errors, availability, queues, resource consumption and business metrics during tests, deployments and incident investigation.

Correlation

A useful dashboard combines context: version, environment, time window and relevant events. Compare metrics with logs, traces and test evidence when necessary.

Grafana Open Source and Cloud

Grafana can run as an Open Source instance or be consumed as a managed service. The choice changes installation, operation and security responsibilities.

Attention point

An attractive dashboard does not guarantee observability. Avoid panels without a purpose, metrics without units or context, and alerts that nobody can turn into action.
