

Maestro

Declarative mobile automation based on YAML flows.

What is it?

Maestro is a technology/platform relevant to Quality Engineering and test automation.

Official site and documentation

Use the official Maestro source as the primary reference: <https://maestro.mobile.dev/>. Official documentation should be the first source for installation, supported versions, syntax changes and new features.

When to use

Use it when the product and team context justify this type of automation or infrastructure.

Installation and setup

Use the official documentation to install the Maestro CLI and validate the environment before creating and running the first flow.

First use

Validate prerequisites, credentials/devices and run a small scenario before scaling.

Best practices

Keep configuration versioned and troubleshooting documented.

How QA applies it in practice

Use Maestro to automate critical mobile journeys with readable YAML flows, stable selectors and controlled test data. Combine local execution with CI when appropriate and capture evidence for failures instead of relying only on a pass/fail result.

How to start safely

Start from the official Maestro site and documentation. Confirm prerequisites, supported versions, operating system and required permissions. Learn in a controlled environment before using it in a critical workflow.

Using it in a real project

Define where Maestro fits, who owns configuration, how credentials and data are handled and how results are shared. Integrate it into the team workflow instead of creating an isolated activity.

Common issues and troubleshooting

When Maestro fails, verify versions, dependencies, permissions, connectivity, data and environment before assuming a product defect. Preserve the original error and reduce the issue to the smallest reproducible case.
