

UAT - User Acceptance Testing

Acceptance validation to confirm that the solution meets business needs and is ready for expected use.

What is UAT?

User Acceptance Testing validates whether the solution meets real business needs and is acceptable for use. The perspective is different from simply looking for technical defects: we want to confirm that processes, rules and results allow the user or business to achieve its objectives.

Who participates

Business users, client representatives, Product Owners or representative users usually execute or approve UAT. QA can prepare environment, test data, scenarios, evidence and support, but UAT should not be treated simply as another QA testing round.

Test basis

Use acceptance criteria, business processes, real journeys, critical rules and representative data. The focus should be “does this meet the business need?” and not only “does the screen work?”.

How to prepare

Define scope, participants, environment, access, test data, schedule, entry/exit criteria, severity, defect handling and approval format. Poor preparation creates false blockers.

Practical example

In e-commerce, a business representative can validate a complete purchase: find a product, apply a commercial condition, choose delivery, pay, receive confirmation and verify correct order creation. The flow represents a real operation.

QA role

QA facilitates, clarifies scenarios, collects evidence, helps reproduce problems and separates defects from business questions or incorrect test data. The acceptance decision belongs to the business stakeholders.

Defects and accepted risks

Not every problem needs to prevent acceptance. The business may accept a known risk with a remediation plan. This decision should be explicit and recorded.

Quick checklist

Scope; participants; environment; access; data; journeys; acceptance criteria; defects; risks; evidence; formal approval.

QA Mindset

UAT does not ask only “does it work?”. It asks “does this solution solve the business problem in an acceptable way for the people who will use it?”.
