

QA LAB BRASIL

Reference guide - QA Lab Brasil

How to Test?

Practical checklists to turn common features into test scenarios.

Login, registration and recovery

Validate positive and negative paths, required fields, formats, messages, sessions, permissions, lockouts, recovery and device behavior.

Search, filters and sorting

Cover existing and missing data, special characters, filter combinations, reset, persistence, pagination, sorting and perceived performance.

Checkout, payment and integrations

Cover cart, price, discounts, stock, address, shipping, approved/declined payments, idempotency, order creation, emails and downstream integrations.

QA Tip: Do not start from the screen only: identify rules, risks, integrations, data and user states.
