

QA LAB BRASIL

Reference guide - QA Lab Brasil

Salesforce for QA

Practical view of CRM, Sales/Service/Commerce Cloud, configuration, integrations and testing risks.

What Salesforce is

It is a cloud platform for CRM and enterprise applications. QA should distinguish configuration, customization, data, permissions and integrations.

What to test

Profiles and permissions, business rules, fields, workflows/flows, integrations, data, notifications, Web experience and behavior after deployments.

Commerce Cloud

In digital commerce, QA may validate catalog, promotions, inventory, cart, checkout, orders and integrations with ERP, payment and external services.

Regression and environments

Configuration changes may affect multiple flows. Compare environments, data and permissions and keep traceability between requirements, configuration and evidence.

QA Tip: On configurable platforms, not every defect is code-related: configuration, data and permissions are also common causes.
