

GitHub Actions

CI/CD automation integrated with GitHub.

Workflows

YAML workflows in `.github/workflows` react to push, pull_request or manual triggers.

QA in pipelines

Automation can run linting, unit/API/Web tests, generate reports and block merge/deploy when gates fail.

Security

Use GitHub Secrets/variables for sensitive data and restrict workflow token permissions.

QA Tip

A green pipeline does not replace analysis of coverage, risk and test quality.
