

Node.js for QA

JavaScript runtime used by Playwright, Cypress and automation ecosystems.

What it is

Node.js runs JavaScript outside the browser and powers many modern testing tools.

QA daily use

node, npm and package.json scripts are commonly used to install dependencies and run tests.

First commands

Check node --version and npm --version. In existing projects, npm install installs dependencies and npm test may run the configured suite.

QA Tip

Check the Node version required by the project before upgrading the runtime.
