

Scrum

Agile framework for complex product development through short inspection and adaptation cycles.

Structure

Scrum organizes work in Sprints and defines accountabilities for Product Owner, Scrum Master and Developers.

Events

Sprint, Planning, Daily Scrum, Review and Retrospective create inspection and adaptation cadences.

Artifacts

Product Backlog, Sprint Backlog and Increment make work and goals transparent.

QA in Scrum

Quality belongs to the team. QA contributes to refinement, acceptance criteria, risk, automation and continuous feedback.

QA Tip

Use Scrum events to surface risk early; do not wait until Sprint end to start testing.
