

ERP, SAP & Enterprise Integrations

Concepts for QA to understand orders, inventory, invoicing and data flowing across enterprise systems.

ERP in simple terms

ERP integrates business processes such as purchasing, inventory, invoicing, finance and logistics. SAP is a widely used ecosystem for this type of operation.

Integration

An order may start in e-commerce and move to ERP, inventory, invoicing and logistics. QA should validate identifiers, statuses, quantities, amounts and processing times.

Synchronous and asynchronous

Not every update is immediate. APIs may respond instantly while queues, jobs and batches may process information later.

Reconciliation

Compare source and destination: quantity sent, quantity received, amounts, statuses and rejected records. Differences should be traceable.

When to use it

Use this knowledge when product risk, architecture or the delivery stage requires this type of validation. Confirm the goal, environment, required data and expected evidence before starting.

How QA applies it

Start from the behavior or risk to validate, prepare data and environment, execute the technique or tool reproducibly and capture evidence that helps the team understand the result.

QA tip

When the UI looks correct but ERP data is wrong, investigate the data path and identifiers used by each integration.
