

How to Test?

Practical checklists to turn common features into test scenarios.

Login, registration and recovery

Validate positive and negative paths, required fields, formats, messages, sessions, permissions, lockouts, recovery and device behavior.

Search, filters and sorting

Cover existing and missing data, special characters, filter combinations, reset, persistence, pagination, sorting and perceived performance.

Checkout, payment and integrations

Cover cart, price, discounts, stock, address, shipping, approved/declined payments, idempotency, order creation, emails and downstream integrations.

When to use it

Use this knowledge when product risk, architecture or the delivery stage requires this type of validation. Confirm the goal, environment, required data and expected evidence before starting.

How QA applies it

Start from the behavior or risk to validate, prepare data and environment, execute the technique or tool reproducibly and capture evidence that helps the team understand the result.

Good practices

Prioritize high-impact scenarios, keep data and environments controlled, record important decisions and review the approach periodically to avoid redundant or outdated coverage.

QA tip

Do not start from the screen only: identify rules, risks, integrations, data and user states.
