

Localization & Internationalization Testing

Languages, currencies, dates, time zones, characters and content consistency in global products.

Internationalization vs Localization

Internationalization prepares software for multiple languages and regions. Localization adapts content, formats and experience for a specific locale.

What to test

Translations, clipped text, text direction when applicable, currency, decimal separators, dates, time zones, phone, address, special characters and sorting.

Consistency

Menus, placeholders, error messages, emails, PDFs and chatbots must follow the selected language. Mixed languages and keys such as undefined are defects.

Our own QA Lab

PT-BR, EN and ES will be treated as complete features, with Language QA before publication.

When to use it

Use this knowledge when product risk, architecture or the delivery stage requires this type of validation. Confirm the goal, environment, required data and expected evidence before starting.

How QA applies it

Start from the behavior or risk to validate, prepare data and environment, execute the technique or tool reproducibly and capture evidence that helps the team understand the result.

QA tip

Changing the menu language is not enough: test the whole journey, including messages, downloads and dynamic content.
