

Node.js for QA

JavaScript runtime used by Playwright, Cypress and automation ecosystems.

What it is

Node.js runs JavaScript outside the browser and powers many modern testing tools.

QA daily use

node, npm and package.json scripts are commonly used to install dependencies and run tests.

First commands

Check node --version and npm --version. In existing projects, npm install installs dependencies and npm test may run the configured suite.

When to use it

Use this knowledge when product risk, architecture or the delivery stage requires this type of validation. Confirm the goal, environment, required data and expected evidence before starting.

How QA applies it

Start from the behavior or risk to validate, prepare data and environment, execute the technique or tool reproducibly and capture evidence that helps the team understand the result.

Good practices

Prioritize high-impact scenarios, keep data and environments controlled, record important decisions and review the approach periodically to avoid redundant or outdated coverage.

QA tip

Always connect the practice to product risk and the evidence needed for quality decisions.
