

QA Workspace

Shortcuts for recurring work: analyze stories, create checklists, structure bugs, calculate execution and consult tools.

Analyze a User Story

Check goal, actors, rules, acceptance criteria, dependencies, data, states, errors, permissions and non-functional requirements before creating cases.

Quick checklist

Use checklists for Smoke, Go-Live, deployment, upload, login and recurring routines. Checklists reduce omissions but do not replace exploration.

Quick metrics

Calculate progress, Pass/Fail/Blocked Rate and coverage with clear denominators. Always show the period and population being analyzed.

Next evolutions

The Workspace can later bring together a Bug Report generator, JSON tools, Risk Matrix, synthetic data and QA Assistant integration.

When to use it

Use this knowledge when product risk, architecture or the delivery stage requires this type of validation. Confirm the goal, environment, required data and expected evidence before starting.

How QA applies it

Start from the behavior or risk to validate, prepare data and environment, execute the technique or tool reproducibly and capture evidence that helps the team understand the result.

QA tip

Quick tools should reduce mechanical work and free time for analysis and investigation.
