

SonarQube

Complete Installation & Setup

Beginner guide - from download to first use

Objective

By the end of this manual, you should be able to install the tool, validate the installation, perform the first functional use and recognize common errors. Do not skip validation steps: they confirm that each stage actually worked.

Before you start

SonarQube Server requires a supported Java/database/environment according to the selected edition/version. For evaluation, Docker is often the simplest isolated route.

Official download and documentation

<https://www.sonarsource.com/products/sonarqube/>

Attention

Use only test environments, accounts and devices when a tool can capture traffic, run scans, modify infrastructure or access data. In corporate environments, follow your organization policies.

Open the correct terminal

On Windows, use CMD or PowerShell. On macOS and Linux, use Terminal. Run commands exactly as shown and press Enter after each line.

Windows - step by step

Follow the official SonarQube Server installation method or use Docker Desktop for a local evaluation.

```
docker run -d --name sonarqube -p 9000:9000 sonarqube:community
```

macOS - step by step

Use the official package/archive or Docker for a local evaluation.

```
docker run -d --name sonarqube -p 9000:9000 sonarqube:community
```

Linux - step by step

Use the official archive/package or Docker and follow kernel/database prerequisites for production-like use.

```
docker run -d --name sonarqube -p 9000:9000 sonarqube:community
```

Validate the installation

1. docker --version

```
docker --version
```

Commands and configuration

1. docker run -d --name sonarqube -p 9000:9000 sonarqube:community

```
docker run -d --name sonarqube -p 9000:9000 sonarqube:community
```

Runs the initial functional validation. Read the complete output and confirm there are no failures.

PATH, environment variables and a new terminal

When an installer adds an executable to PATH or you configure a variable such as JAVA_HOME/ANDROID_HOME, close the old terminal and open a new CMD/PowerShell. Then repeat the version command. If multiple versions are installed, use where <command> on Windows or which <command> on macOS/Linux to identify the executable being used. Do not remove PATH entries without understanding their origin.

Create a safe test folder

For the first tests, use a simple folder with no production files, for example C:\Projects\qa-lab or ~/qa-lab. This makes generated files, virtual environments, logs and configuration easier to identify.

First use / functional test

1. Open <http://localhost:9000> after the container becomes healthy.

Expected result

The SonarQube container remains running and the web UI loads on port 9000.

Troubleshooting

- Read the terminal error before repeating commands. Check PATH/environment variables, runtime version, permissions, system architecture and whether a new terminal was opened after environment changes.
- Command not found: confirm the installation directory is on PATH and open a new terminal.
- Wrong version: check whether another older runtime or executable appears earlier on PATH.
- Permission denied: use a user-writable project directory and follow the vendor permission guidance; do not blindly run everything as administrator/root.
- Corporate proxy/firewall: configure the package manager/tool according to your organization network policy rather than disabling security controls.

Final checklist

- Official download and documentation
- Windows - step by step / macOS - step by step / Linux - step by step
- Validate the installation
- First use / functional test
- Expected result
- Troubleshooting

Installation validated. Keep this manual for reinstallations, onboarding and troubleshooting.
