

BrowserStack

Cloud platform for testing across browsers, operating systems and real devices.

What is it?

BrowserStack provides remote infrastructure for Web and Mobile testing across browser, OS and device combinations.

When to use

Useful for cross-browser, real-device mobile testing, compatibility and distributed automation.

Manual and automated

It can support manual sessions and automation with frameworks such as Selenium, Playwright and Appium depending on the product.

Coverage strategy

Do not test every possible combination. Prioritize user analytics, risk, supported versions and defect history.

Cautions

Protect credentials, data and private URLs; validate corporate security rules before using external services.

Installation and configuration - overview

Always use the official website and documentation. Check prerequisites and compatible versions, install for your operating system, configure environment variables or PATH only when required, validate the installation with the recommended command or screen, and run a first project/test before integrating it into the QA workflow.

QA tip

■ QA Tip: device cloud expands coverage but does not replace risk-based compatibility strategy.
