

Functional Testing

Validation of system behavior against requirements, business rules and observable expectations.

Purpose

Functional testing verifies what the system does, focusing on inputs, rules, outputs, states and integrations.

Coverage

Cover happy, alternative, negative, boundary, permission and business-rule scenarios, prioritized by risk.

Web, Mobile and API

The same functional logic can be validated through Web UI, Mobile apps, APIs or system integrations.

Evidence

Record data, environment, relevant steps, expected and actual results and reproducible evidence.

When to use it

Use this knowledge when product risk, architecture or the delivery stage requires this type of validation. Confirm the goal, environment, required data and expected evidence before starting.

How QA applies it

Start from the behavior or risk to validate, prepare data and environment, execute the technique or tool reproducibly and capture evidence that helps the team understand the result.

QA tip

Test behavior and business rules; do not reduce functional testing to clicking the UI.
