

QA Lab Brasil

QA Toolkit

Quick tools to support recurring QA work.

Quality calculators

Pass Rate, execution progress, Failure/Blocked Rate, automation coverage and risk matrix calculations can use user-provided data.

Technical utilities

JSON Formatter/Compare, URL Encoder/Decoder, Timestamp Converter and synthetic test-data generators support investigations and preparation.

Templates and checklists

Bug Report, Test Case, Test Plan, Smoke Report, UAT Report, Go-Live and Risk Matrix templates are available for reference and download.

When to use it

Use this knowledge when product risk, architecture or the delivery stage requires this type of validation. Confirm the goal, environment, required data and expected evidence before starting.

How QA applies it

Start from the behavior or risk to validate, prepare data and environment, execute the technique or tool reproducibly and capture evidence that helps the team understand the result.

Good practices

Prioritize high-impact scenarios, keep data and environments controlled, record important decisions and review the approach periodically to avoid redundant or outdated coverage.

QA tip

A good tool reduces repetitive work but does not replace critical analysis.
