

Web Testing

Browser, DOM, DevTools, sessions, storage, responsiveness and web application investigation.

Frontend and DOM

HTML structures the page, CSS provides presentation and JavaScript adds behavior. The DOM is the representation exposed by the browser for interaction and automation.

DevTools for QA

Network helps analyze requests, responses and timings; Console shows errors and logs; Application exposes cookies and storage; Elements helps understand DOM and styles.

Compatibility and accessibility

Test browsers, resolutions, keyboard use, zoom, contrast, focus and responsive behavior. The experience should remain functional across devices and access needs.

When to use it

Use this knowledge when product risk, architecture or the delivery stage requires this type of validation. Confirm the goal, environment, required data and expected evidence before starting.

How QA applies it

Start from the behavior or risk to validate, prepare data and environment, execute the technique or tool reproducibly and capture evidence that helps the team understand the result.

Good practices

Prioritize high-impact scenarios, keep data and environments controlled, record important decisions and review the approach periodically to avoid redundant or outdated coverage.

QA tip

When a button fails, inspect Console and Network before concluding it is only a visual issue.
